CONFIDENTIAL

FREQUENCY LIST

by Robert B. Grove

Listeners are reminded that the U.S.A. Communications Act of 1934, Section 305, as amended (47 U.S.C. Section 605), prohibits anyone, not authorized by the sender, from intercepting any radio communication not intended for reception by the general public, and divulging or beneficially using that information from such monitoring.

Third Edition

CONFIDENTIAL

Frequency List

by Robert B. Grove

Foreword

Radio communications continues to play a vital role in the daily functioning of today's society. At this low point in the sunspot cycle, tens of thousands of radio signals are crammed into a very small part of the HF spectrum. Although sophisticated techniques make identification of some signals virtually impossible, you can still tune across the shortwave band and intercept hundreds of interesting non-broadcast and non-ham radio transmissions.

These transmissions can be Coast Stations calling ships at sea, military aircraft calling ahead for weather information, voice mirrors of Fixed Service stations, an Embassy Station sending encoded ambassadorial instructions, RTTY press, FAX, etc. Identification, however, is frustrating because only the International Telecommunications Union (a treaty organization based in Geneva, Switzerland) makes any effort to register radio transmitters and frequencies. This is done on a purely voluntary basis by each country with various degrees of timeliness and accuracy.

Any listener can spend \$1500.00 to obtain a complete set of ITU Callbooks and Frequency Lists. Unfortunately, this would provide far more information than needed—and wouldn't include thousands of signals that are not officially registered with the ITU.

The answer to this dilemma is the CONFIDENTIAL FREQUENCY LIST—a distillation of various data sources, cross-checked by hundreds of monitors throughout the world. In this all-new edition, a selection has been made of the most interesting non-broadcast frequencies and services; including many channels and stations never previously identified in print.

It is specifically not the intent of either the author or the publisher to jeopardize any national's security through divulgence of classified material. Virtually every station and frequency mentioned in the CONFIDENTIAL FREQUENCY LIST has been, or can be, heard by the casual listener with modest receiving equipment. Identifications were made from unclassified Federal and international documents. It is, however, necessary to stress that the U.S.A. Communications Act of 1934 (as amended) specifically prohibits your divulging the content of received radio communications to a third party, or using the content for personal gain.

Assembling a compendium like the "CFL" is made possible by the cooperation of many individuals. In particular I would like to thank Walter Hahn for his contribution of RTTY source material; Vince Hughes, WB4KIE, who isn't just satisfied with listening, but looks for transmitter sites; and my editor/publisher, Perry Ferrell for his valued cross-checking. Thanks also to the monitors that supplied important observations of difficult to hear stations. Last—and as any author knows—it takes a toll on family life; so to my son, Bill, my frown is gone. To Judy, my wife, my continued admiration for your patience; and to you both, my deepest love.

ROBERT B. GROVE

January, 1976

Listening In Below 100 kHz

Specialized communications receivers—such as the Drake DSR-2 and National HRO-500—have encouraged casual listening for stations operating below 100 kHz. While only 15 years ago this was a desolate part of the radio spectrum, it's now packed with a variety of CW and RTTY (very narrow shift) signals. Because of the propagation characteristics of the very low frequencies, many of the "super-power" nations use super-powerful transmitters below 30 kHz to communicate (one-way) with their patrolling nuclear submarines. Transmitters with input powers of 1,000,000 watts are not uncommon. Below 14 kHz there are highly sophisticated navigational systems (USA "Omega") operating around the world. Both the USSR and USA systems can be heard just about anywhere at any time. Radiolocation and navigational systems also use frequencies around 70, 85 and 100 kHz. Many of the stations in this list are "Fixed Service" point-to-point (used during ionospheric storms) or message handling to ships at sea. When the communications path or circuit had been identified and filed with the ITU, it is included in the material below.

C.I.R.M.

Unique can be an easily overworked word when describing some of the specialized radio communications services in the HF spectrum. Nevertheless, the "Centro Internazionale Radio-Medico (CIRM)" is unique, and one of its kind. The CIRM was established in Rome, Italy about 40 years ago to provide medical advice to ships at sea. Unlike other radio medical services, the CIRM has a staff of doctors and specialists on continuous around-the-clock duty. CW operators at CIRM maintain listening watches on all of the maritime bands for direct calls or relays from major coast stations (St. Lys, Manila, etc.). Calls may be in Italian, French or English. Thanks to Gerd Klatwitter for this background information.

4342	IRM	Rome, Italy (used on request)
4350	IRM2	Rome, Italy (secondary usage)
6365	IRM3	Rome, Italy (used during winter nights)
6420	IRM	Rome, Italy (secondary usage)
8685	IRM4	Rome, Italy (used on request)
12,760	IRM5	Rome, Italy (PRIMARY)
12,748	IRM	Rome, Italy (secondary usage)
17,105	IRM6	Rome, Italy (used during winter days and throughout summer)
22,525	IRM7	Rome, Italy (secondary usage)

3

Embassy Stations

Tantalizing mystery stations on the short wave bands fall into two categories; the "Numbers Stations" and the "Embassy Stations." The latter are an odd mix of clearly identified calls or frequencies and total "unknowns." A few governments reveal embassy calls and frequencies to the ITU, most do not. Thus, this compilation has been difficult to verify since it comprises some ITU material and a lot of off-the-air monitoring. Many of the frequencies have been measured, but may vary by 10 to 15 kHz as stations move up and down the band to escape interference. Most of the traffic heard on embassy frequencies is CW, although there was an increased use of RTTY in 1975. Very little SSB traffic has been observed.

SPECIAL NOTES: Some governments permit a foreign embassy to use the call prefix of the host country—such as the USA with its use of the "KNY" prefix. Other countries use the prefix from their homelands—such as Sweden, Kuwait, Finland, etc. The USA also seems to share their embassy facilities with military missions and in these instances an "A" prefix will appear in the listing. Obviously, the number of foreign embassies with radio facilities is many times the number listed, but finding an unknown radio frequency is virtually impossible [for example, we were unable to find the frequencies for the Dutch Embassies—other than 18,713 kHz—nor, as a matter of fact, could we identify the numerous USA call signs sometimes heard on what might otherwise be considered "Embassy" channels].

United Nations

The communications network of the United Nations occupies a unique position in world affairs. On one hand, the system must provide high quality worldwide point-to-point CW and RTTY (plus a little SSB) communications, while simultaneously providing medium-range communications within a very changeable zone of responsibility. The list below attempts to combine both network functions. Although some stations may be off the air by the time this is in print, certain frequencies are used with great consistency and these channels would undoubtedly be used in any future crisis.

kHz	Callsign(s)	Location	Remarks
3202.5	4UEC	Cairo, Egypt	Arab/Israeli Dispute
	4UNA	Amman, Jordan	"
	4UNB	Beirut, Lebanon	"
	4UNC	Ismailia, Egypt	"
	4UND	Damascus, Syria	"
	4UNG	Gaza, Egypt	"

Coast Stations

The International Telecommunications Union defines a "Coast Station" as a land station in the maritime service. This is a broad category since Coast Stations can be involved in many activities—ranging from personal telegram transmissions to weather reports, or from medical advice to fuel consumption reports. In this issue of "CFL", the Coast Stations using AM/SSB voice are separate from those using CW and AMVER separate from MEDICO or Ice Patrol. This particular list is not intended to include every active Coast Station, but only those that have been heard during 1975. Most of the stations—when monitored—were transmitting V-markers, QRA tapes, or traffic lists; all were using moderately fast CW. The power column was derived from figures supplied by the ITU. The asterisk after the callsign indicates that the ITU does not have a record of that particular station using the frequency listed.

Antarctica

Certain scientists are quick to point to the studies being made on the Antarctic continent as a prime example of useful international cooperation. Although no one nation has staked a claim to the Antarctica, there appears to be a tacit understanding about the nationality of certain outposts and bases. As this list was being prepared, about a half dozen countries were maintaining bases on the continent. The frequencies shown below are those recognized by the ITU (except for the USSR calls and frequencies) and which have been operational within the past two years. Traffic is about 50% RTTY with the remainder split between CW and SSB.

Foreign Military

In the interest of nationalistic security, military radio stations attempt to conceal their identity—some more than others. Many military stations use sophisticated communication techniques (secure RTTY, bursts, etc.) and the number of CW or SSB stations is declining—year by year. This list includes a variety of CW or SSB signals reported by our monitors in Australia, Europe or North America, partially verified by information obtained from the files of the ITU.

kHz	Call	Location	Service	Nationality

INTERPOL

If you think it is difficult to escape police/detective stories on TV, imagine the chagrin of the international criminal who finds that his police records follow him around the world. The shortwave network of the "International Criminal Police Organization" (INTERPOL) is alive with RTTY and CW messages (estimated in excess of 10,000,000 words per year). Virtually all of the information is coded and pertains to crimes committed, methods of operating, identification, etc. The INTERPOL headquarters are outside of Paris, France, in St. Cloud where there are 12 transmitters (500 to 3000 watts) on call. Not all INTERPOL members have radio talkback circuits (notably there is none listed for the USA—although this is questionable). Since the previous listing in CFL, two new stations have come on the air—5BP2 in Nicosia, Cyprus and 5YG in Nairobi, Kenya. Reports from our monitors indicate that certain frequencies are primaries and these are underlined in the listing.

9 Communist Broadcast Feeders

Mainland China, North Korea and the Soviet Union employ a number of SSB broadcast program feeders and relay stations—many of which can be heard in North America. Some of these feeds are necessitated by the lack of high quality telephone lines and microwave links across the vast land areas of China and the USSR. The China feed to Radio Tirana, Albania is a special case and similar to the scores of feeders used by the VOA, BBC, etc. Listeners will note that some feeds are reversed tape recordings making identification difficult (reverse tapes make playback easier for the relay broadcaster). These stations were monitored during the latter part of 1975, but all frequencies are subject to erratic changes.

10

R.C.M.P.

The Royal Canadian Mounted Police has a vast expanse of land area to protect—an undertaking that would be virtually impossible without radio communications. Several years ago, the RCMP installed an inner-Canadian network of medium-power SSB transmitters. This system replaced and/or augmented an older network of AM transmitters. Some RCMP stations in the smaller outposts continue to use AM and are found on 4475 kHz (mostly Alberta), 4775 kHz (mostly British Columbia and some Ontario), or 4785 kHz. There appears to be occasional use of CW. Under a dozen stations operate on 2326, 2788 or 3325 kHz. As this list was being prepared, the principal frequencies used in the SSB networks were 4783.5, 4786.5, 7781.5, 9106.5 and 14,621.5 kHz. The frequency of 7778.5 kHz is used for general broadcasts and is not a talkback circuit. According to the ITU, station XJD48 uses 4785 kHz for communication with Washington, DC and XJA54 uses 4805 kHz for communication with Spokane, WA.

The number of radioteletype stations in the shortwave spectrum is increasing at an unbelievable rate. The reasons are easy to enumerate; more words or figures per minute of air time, a "hard copy" printout for filing and a payroll saving by eliminating the specialized CW operator—modern sophisticated receivers are either computer controlled or can be tuned by the most inexperienced operator. RTTY communications can be divided into three general categories; traffic, weather and press. This listing deals only with RTTY stations that have been monitored recently while transmitting news and press reports. Weather service RTTY stations are in a separate list and traffic RTTY stations appear in various other lists throughout this edition of CFL. Commonly accepted SWL identifications for languages are used in this list: AA for Arabic, EE for English, FF for French, GG for German, II for Italian, JJ for Japanese, PP for Portuguese, RR for Russian and SS for Spanish. The asterisk indicates that the station and/or frequency is not cataloged by the ITU. Listeners should particularly note that all RTTY press material is considered "privileged" information and to maintain some semblance of confidentiality, these stations make frequent changes in operating schedules and/or frequencies.

Numbers Stations

One of the most intriguing things to be heard in the shortwave spectrum is a transmission from a "numbers station." A few imaginative listeners believe these transmissions emanate from spy stations—reminiscent of similar activities during World War II. In general, the numbers transmissions are short broadcasts—usually amplitude modulated—made by a woman announcer reading 4 or 5 digit number groups in the Spanish language. English and German have also been heard from time to time. Single Sideband usage, as opposed to AM, is very minor and confined to the higher frequencies. However, even after hundreds of monitors have made thousands of loggings there is still surprisingly little known about the numbers transmissions. It is convenient—and fashionable—to place the source of all of the transmissions on the doorstep of the Central Intelligence Agency. One factor favoring that arrangement is that some transmissions appear to originate from transmitters that must be close to Washington, DC or Miami, FL. On the other hand, numerous transmissions couldn't be heard on the frequencies and at the times that favor either site. But regardless of the transmitter site, what purpose do these transmissions serve that couldn't be served much better in a more covert fashion? It defies logic to broadcast quasi-confidential information via AM unless the purpose is to camouflage the "intent" of the broadcasts by misdirection. Certainly the numbers themselves are meaningless and according to one analysis made by Michael T. Chabak, many transmissions are repeat broadcasts of earlier transmissions—without a figure changed or out of place. Chabak has been able to find "identifiers", "code keys" and "group counts" in the numbers transmissions; although any message, per se, has yet to come to light. This is a list of activity as monitored during 1975.

kHz	Mode	Digits	Time	Remarks
3060	AM	5	0600	Spanish
3090	AM	5	0640	Spanish
3140	AM	5	0540	Spanish
3220	AM	5		In German with music box ID
3265	AM	8		In Spanish with piano ID
3280	AM	5	0530	In German
3365	AM	5		In German with music box ID and parallel with 3220. Also reported with male announcer in Spanish
4010	AM		1750	In German, heard in Europe

FCC Backup Net

In the course of its monitoring operations, the Federal Communications Commission occasionally makes use of its HF backup network. With monitoring posts situated throughout continental United States, plus Hawaii and Puerto Rico, the FCC can triangulate for the location of illegally operating transmitters. This sort of information and other routine matters are handled by RTTY (monitored as 60/170). From time to time there is some CW traffic and a few stations are equipped for SSB.

Canadian LF Aero Beacons

Localized Canadian weather forecasts can be heard in the low frequency band over numerous non-directional aero beacons. These stations have three patterns of broadcasting: continuous weather and flight advisory bulletins (only from Abbotsford, Montreal, Toronto and Vancouver), or taped announcements at the hour +17 and +47 minutes (signified in the list below by the single asterisk), or +20 and +50 minutes after the hour (signified by the double asterisk). This is a list of stations most likely to be heard in southern Canada and the northern section of the USA. Power output from these stations average 400 watts.

Department of Justice Backup Net

Although virtually all Federal agencies require extensive communications networks between their division offices, most traffic is handled by landline or microwave. Numbered among the Federal agencies with HF backup networks is the Department of Justice — particularly the Federal Bureau of Investigation and the Border Patrol. In this listing, the interlocking of frequencies and sites is particularly obvious around 4617.5 and 5912.5 kHz. Much of the traffic on these nets will be in RTTY. Most stations maintain CW facilities and many Border Patrol stations are using backup SSB equipment. Also note that KGE53 is used for communications with the Canadian authorities and KGE49 with the Brazilian Federal Police.

PLACE NAMES: It is to be expected that there will be some disagreement with our spelling of place names. Although we have used the latest reference works, many place names are not readily translated into "Americanized English." For example, our "Jidda, Saudi Arabia" is the old city of "Juddah," although in many British texts this city would be spelled "Jiddah" while the ITU Frequency Lists spell it "Jeddah." Teheran and Tehran appear interchangeably in various references, although the latter spelling is now preferred.

16

Fixed Service Stations Monitored

The International Telecommunications Union has defined the Fixed Service as "a radiocommunications service between specified fixed points." This is a broad definition and encompasses radio stations broadcasting messages in the aeronautical, coast, press, weather and military services—as well as—stations engaged in strictly point-to-point communications for governmental or commercial purposes. In this major listing, some liberties have been taken to ease your identification of certain Fixed Service stations. So-called "voice mirror" or endlessly repeated tape recordings are identified by the "#" sign immediately after the Mode abbreviation. CW, FSK (RTTY), LSB, USB and ISB (independent sideband) modes are shown wherever possible. Virtually all of these stations were monitored in 1975. The asterisk indicates that no correlation between the monitored station and the ITU lists could be found. Note that Coast Stations operating voice mirrors are shown in this list and should not be confused with the Coast List of CW stations starting on page 22. Additional Fixed Service stations appear in the RTTY Press and FAX/RTTY Weather Lists.

THOSE "OFFICIAL" LISTS: A variety of sources were used in cross-checking and correlation of the content of the CONFIDENTIAL FREQUENCY LIST. The principal source was the International Telecommunication Union, Geneva, Switzerland. The ITU publishes extensive frequency lists and callbooks. A limited stock of some ITU publications is maintained by GILFER Associates, P.O. Box 239, Park Ridge, NJ 07656. . . . THOSE "SIDEBAND" FREQUENCIES: The crowded conditions in the HF spectrum have necessitated the introduction of "sideband" vs. "center" or "carrier" frequencies. Unfortunately, the distinction is not universally accepted—either by Governmental agencies or some of our monitors. A deviation of ± 1.5 kHz from the suppressed carrier frequency is likely to be found when demodulating certain SSB signals.

17

VOLMET & Aero Weather

The experienced listener to the stations in the HF spectrum has little difficulty collecting "tidbits and trivia"—like the weather and flight conditions in Agana, or Calgary, or Amsterdam. Anyone can tune in these routine AM weather broadcasts by picking and choosing the time and frequency. Known as VOLMET (a contraction of a French language phrase meaning flying weather), the stations below operate around the clock (except where noted), usually twice each hour, broadcasting short descriptions of weather conditions at major airports or cities. A listener to Prague, for example, would soon know the weather not only in Prague, but Vienna, Berlin, Budapest, Warsaw and Moscow, as well. This list also includes a few of the better heard VOLMET stations in the USSR (only English transmissions are shown—there are about 15 more VOLMET stations in the USSR broadcasting in the Russian language) and some military SSB transmissions.

18 LF Broadcasting Stations

Broadcasting stations operating between 150 and 300 kHz represent a minor fraction of the total number of AM broadcasters in Europe and Asia. If the number is small, the same cannot be said for the output wattages—frequently up to 2,000,000 watts (40 times the "high power" AM station in the USA). There is some uncertainty regarding the Soviet Union broadcasters, but in the absence of information to the contrary, it may be assumed that all of the listed stations are in daily operation.

Broadcast Feeders

To make their "voice" heard is the prime objective of shortwave broadcasting—free world, third world or communist. Many major broadcasters have erected relay transmitting sites thousands of miles from their homeland—just to make sure that the target audience doesn't escape. Up-to-the-minute programming is piped to these sites by either satellite relay or HF feeders. This is a listing of the non-communist feeders—a list of communist feeders is on page 35. The transmitting site, mode and operator have been itemized—callsigns are not used. Some frequencies were being changed as this book was going to press and all known new channels have been included, as well as, channels that may be closing down. Also listed are RTTY channels used for relaying press and routine business matters. Not listed are some of the frequencies used for special program relays, such as, WFL25 on 15,730 with RFE material, or CUA77 on 15,957 with Emissora Nacional (Portugal) programs. An asterisk in the "Location" column indicates that no correlation can be found in the frequency lists and callbooks of the ITU.

20 Time Signals & Standard Frequencies

Highly accurate time signals are radiated by two distinctly different types of radio stations. One group can be classified "Standard Frequency Stations"—the other can be loosely called "Coast Stations." The first group are assigned carrier frequencies useful for receiver calibration and laboratory measurement (2500, 4500, 5000, etc. kHz). The second group operate mostly in the maritime bands and appear to be broadcasting time signals to ships at sea. There are a few unlisted stations occasionally broadcasting time signals that fit neither category. An example is YVTO, Caracas, Venezuela broadcasting time signals on 6100 kHz in the middle of the 49-meter International Broadcasting Band. The Fixed Service stations in Montevideo, Uruguay are also known to broadcast time signals rather than use a voice mirror (see page 49). For the convenience of the reader, the time signals below have been divided into the two above-mentioned lists.

STANDARD FREQUENCIES

kHz	Call	Location	Schedule
2500	FFH	St. Assise, France	0800-1625, Monday to Friday
	JJY	Tokyo, Japan	continuous, 24 hours
	MSF	Teddington, England	0000-0005, 0010-0015, 0020-0025, 0030-0035, 0040-0045 & 0050-0055 minutes after each hour, continuous
	OMA	Liblice, Czechoslovakia	0001-0040 & 0045-0001, continuous, 24 hours
	RCH	Tashkent, USSR	0015-0020, 0025-0030, 0035-0040 & 0045-0050 after each hour from 1100 to 0400, September through March Also, 1600 to 0200, April through August
	WWV	Fort Collins, CO	continuous, 24 hours
	WWVH	Kauai, HI	continuous, 24 hours
	ZLFS	Lower Hutt, New Zealand	0100-0400, every Wednesday only
	ZUO	Pretoria, South Africa	1800-0400, daily
3330	CHU	Ottawa, Canada	continuous, 24 hours
4500	VNG	Lyndhurst, Australia	0945-2130, daily
4996	RTA	Novosibirsk, USSR	continuous, 24 hours
5000	BPM		one minute transmissions at 1329, 1359, 1429, 1459, 1529 & 1559, daily
	BPV	Shanghai, P.R.C.	0000-0345, 0400-0545, 0600-0945 & 1000-1200, daily

AMVER

The word AMVER is the acronym for "Automated Mutual-assistance Vessel Rescue System." This is a free and voluntary program operated by the U.S. Coast Guard. Ships at sea are encouraged to send sailing plans and position reports through a network of Coast Stations to the AMVER Center in New York City. These data are fed into a large computer and the voyages (about 10,000 per month) can be quickly analyzed in times of emergency. The emergency printouts provide Sea-Air-Rescue agencies with the predicted locations of nearby vessels—expediting any possible assistance. This is a list of Coast Stations with their working frequencies that accept AMVER position reports. All of this traffic is in CW. Some Coast Guard stations are now working SSB on 4394.8, 6523.2 and 8762.2 MHz.

FAX & RTTY Weather

This composite list of weather radio stations is published more to help establish identities than to provide details on schedules. Both radio services require special receiving equipment and/or techniques to make use of the broadcast information. RTTY stations encode weather data into 5 figure groups, obviating immediate translation and use. The FAX broadcasters—for the most part—are concerned primarily with ocean and sea conditions. These maps require expert interpretation to become intelligible. And, just as the RTTY stations transmit at differing rates and shifts, the FAX stations transmit at 60, 90 or 120 scans per minutes (the 120 scan being the most common). Weather broadcasters are not known for unexpected frequency changes and many of the channels listed below have been in use for years and are likely to remain in use until the early 1980's. The asterisk is used to signify no correlation with material supplied by the ITU.

US Air Force & Navy

This list combines the most frequently monitored channels used by the U.S. Air Force and the U.S. Navy in the HF spectrum. All communication is via upper sideband (USB) and center frequencies are shown. Included in this list are many examples of the codenames that have been heard—plus a few of the better known locations that match the codenames. Some major USAF installations do not resort to codenames and instead use plain language: "MacDill" for MacDill Air Force Base in Florida, or "Lajes Airways" for Lajes Field in the Azores. The Navy adds the prefix "Raspberry" to identify Naval Air Stations ("Raspberry Rosie" is the Roosevelt Roads NAS in Puerto Rico). There are periodic, but wholesale revisions in the codenames, the most recent taking place in early 1975.

KHz	Service	Purpose	Calls Monitored
3095	USN	Atlantic Command	Codename "Mike" channel
3265	USN	Atlantic Command	BAKER BOY, SPARTAN, etc.
4377	USN	Pacific Command	BEAVER (<i>San Clemente Island</i>), BUTTERFIELD (<i>San Diego</i>), DUNKIRK (<i>Honolulu</i>), TORREADOR (<i>San Francisco</i>), etc.
4494	USAF	SAC Bravo Net	DISCORD, FOREST ROW, PARKWAY (<i>Offutt AFB</i>), PAYROLL (<i>Barksdale AFB</i>), SPEAR, STORM, etc.
4623	USN	Atlantic Command	MISSIONARY (<i>Norfolk</i>), Kato Soli, Greece, etc.
4707	USN	Pacific Command	BUTTERFIELD (<i>San Diego</i>), DUNKIRK (<i>Honolulu</i>), TORREADOR (<i>San Francisco</i>), OVERWORK (<i>net call</i>), etc.
4725	USAF	SAC Alfa Net	RACKETBUM
4742	USAF	In-flight	Andersen AFB, Guam
4746	USAF	TAC Secondary	LIBERTY, RASPUTIN (<i>Collins Radio</i>), etc.
5328	USAF	SAC	CIVILIAN (<i>Torrejon AB, Spain</i>), POKERFACE, etc.
5447	USN	Atlantic Command	BIG TOP, CALIPER, UNIQUE, etc.
5505	USAF	In-flight	Kadena AB, Okinawa
5688	USAF	In-flight	Andrews AFB, MD & MacDill AFB, FL
5700	USAF	SAC Bravo Net	CLOUD DASHER, DEMOCRAT (<i>March AFB, CA</i>); Andrews AFB, MD; etc.
5703	USAF	TAC Secondary	GLADHAND, RASPUTIN (<i>Collins Radio</i>), SILVER DOLLAR (<i>mission codename/call</i>), etc.
5710	USAF	In-flight	Albrook AFS, Canal Zone; Elmendorf AFB, AK; Thule AB, Greenland
5722	USN	Atlantic Command	HAMPSHIRE (<i>Ft. Allen, PR</i>), etc.
6680	USAF	SAC Bravo Net	CIVILIAN (<i>Torrejon AB, Spain</i>), PAYROLL (<i>Barksdale AFB</i>), POKERFACE, etc.
6686	USN	In-flight	
6697	USN	Atlantic Command	AIRHEART, HAMPSHIRE (<i>Ft. Allen, PR</i>), HICKORY STICK, IVANHOE (<i>Norfolk</i>), KING TIGER, MIDWAY, MISSIONARY (<i>Norfolk</i>), PORTCALL (<i>Iceland</i>), SPARTAN, TRUST FUND, COAL BIN, etc.
6715	USAF	In-flight	Thule AB, Greenland
6720	USN	Atlantic Command	FANFARE (<i>Morocco</i>), OVERWORK (<i>net call</i>), STONE-WALL (<i>Guam</i>), STRONGBOX (<i>net call</i>), etc.
6723	USN	Worldwide	BRICKYARD, CLOUD DASHER, FIRESIDE, GUNTRAIN, KEY WEST, MAGIC MAN (<i>Ireland</i>), MISSIONARY (<i>Norfolk</i>), OUTCRY, RASPBERRY (<i>various Naval Air Stations</i>), RAWHIDE, SAFEKEEPING, SEA LORD (<i>USS Ori-kany</i>), STONEWALL (<i>CINCPAC</i>), etc.
6738	USAF	In-flight	Andersen AFB, Guam; Clark AB, Philippines; Elmendorf AFB, AK; Hickam AFB, HI; Incirlik AB, Turkey; Loring AFB, ME; Scott AFB, IL & Yokota AB, Japan
6750	USAF	In-flight	Lajes Field, Azores; Loring AFB, ME; MacDill AFB, FL; RAF Mildenhall, England
6753	USAF	TAC	Ascension Island; RCAF; FIRESIDE (<i>Langley AFB</i>)
6761	USAF	SAC Alfa Net	GIANT STEP, OUTWAY/ROYAL FLUSH (<i>Offutt AFB</i>), RETAIL/PAYROLL (<i>Barksdale AFB</i>), WEST CONTROL, etc.
6763	USN	Worldwide	CARDPLAYER, HAMPSHIRE (<i>Ft. Allen, PR</i>), NET LOSS, PRESTO, etc.
6787	USN	Worldwide	BRADBURY, HERSHEY, etc.
6992	USN	Atlantic Command	IVANHOE (<i>Norfolk</i>)
7895	USN	Atlantic Command	OVERWORK (<i>net call</i>), SHERIFF (<i>Bermuda</i>), etc.
8020	USN	Pacific Command	NKW (<i>Diego Garcia</i>)

kHz	Service	Purpose	Calls Monitored
8101	USAF	SAC Bravo Net	
8957	USN	Atlantic Command	HOTEL 8, PHENOMENON (<i>Jacksonville NAS</i>)
8964	USAF	In-flight	Andrews AFB, MD; Hickam AFB, HI & Scott AFB, IL
8967	USAF	In-flight	Andersen AFB, Guam; Hickam AFB, HI; Lajes Field, Azores; McClellan AFB, CA; Thule AB, Greenland & Yokota AB, Japan
8972	USN	Kilo Net	BEER GARDEN (<i>Brunswick, ME</i>), CAVEMAN (<i>Norfolk</i>), FIDDLER (<i>Jacksonville</i>) HURRICANE (<i>Bermuda</i>), etc.

17,080	USN	Atlantic Command	
17,975	USAF	SAC Alfa Net	
17,985	USN	Atlantic Command	IVANHOE (<i>Norfolk</i>)

This is the catch-all section in this edition of the CONFIDENTIAL FREQUENCY LIST. The emphasis here is on frequency and/or channel utilization (if not included in one of the other categories in this book), or who is likely to use what frequency. At the request of many readers of our previous editions, a number of intriguing VHF/UHF channels have been listed.

kHz	Purpose and/or Callsign(s)
179	WGU20, Edgewood Arsenal, MD, information station for the Civil Preparedness Agency
500	Worldwide CW emergency calling frequency
530	Driver safety roadside information service
1606	" " " " "
1608	Beacon "EPO", El Paso Occidente, Colombia
	Beacon "VSA", Villahermosa, Mexico
1610	Beacon "CTG", Cartagena, Colombia
1613	Beacon "RAB", Rabinal, Guatemala
	Beacon "TEQ", Tequesquitengo, Mexico
1614	Driver safety roadside information service
1615	Beacon "BBU", Bobures, Venezuela
	Beacon "PSO", Pato, Colombia
1618	Beacon "LMM", Los Mochis, Mexico
	Beacon "TUL", Tulancingo, Mexico
1618.65	NOAA marker beacons; also at various discretê frequencies up through 1653.425 kHz
1620	Beacon "CEP", Conception, Bolivia
	Beacon "CVH", Calabozo, Venezuela
	Beacon "EBG", El Bagre, Colombia
	Beacon "IZT", Ixtepec, Mexico
	Beacon "NLD", Nuevo Laredo, Mexico
	Beacon "TEH", Tehuantepec, Mexico
	Beacon "URM", Urman, Venezuela
1625	Beacon "CZM", Cozumel, Mexico
	Beacon "MZT", Mazatlan, Mexico
1630	Beacon "MTR", Montera, Colombia
1635	Beacon "PPN", Popayan, Colombia
	Beacon "TJA", Tarija, Bolivia
1638	Beacon "CME", Carmen, Mexico
	Beacon "CPSW", San Javier, Bolivia
	Beacon "PRN", Tapuruxuara, Brazil
	Beacon "PUI", Tefe, Brazil
	Beacon "ZYL", Santarem, Brazil
1640	Beacon "SOG", Sogamoso, Colombia
1643	Beacon "UPN", Uruapan, Mexico
1643.5	Beacon "MAR", Gral San Martin, Argentina
1644.015	Corps of Engineers beacon at Norfolk, VA; also on 1644.425, 1646.015 and 1646.424 kHz
1645	Japanese whale carcass beacons
1648	Beacon "CMM", Camaguey, Cuba
	Beacon "OAX", Oaxeca, Mexico
	Beacon "TIJ", Tijuana, Mexico
1650	Beacon "QIB", Quibdo, Colombia
1650.015	Corps of Engineers beacon at Memphis, TN; also on 1650.44 kHz
1651.515	Corps of Engineers beacon on Arkansas River; also on 1651.915, 1653.015 and 1653.425 kHz
1655	Beacon "CUC", Cucuta, Colombia
1658	Beacon "CPE", Campeche, Mexico
1663	Beacon "CUL", Culiacan, Mexico
1665	Beacon "CIO", Cicuco, Colombia
1668	Beacon "GDL", Guadalajara, Mexico
	Beacon "HMO", Hermosillo, Mexico
	Beacon "MID", Merida, Mexico
1670	Beacon "CZU", Corozal, Colombia
	Beacon "TIKY", Limon, Costa Rica
1674	Beacon "TEP", Tepec, Mexico
1675	Beacon "MTU", Mitu, Colombia

kHz	Purpose and/or Callsign(s)
1675	Beacon "ULQ", Tulua, Colombia
1678	Beacon "MOJ", Mojoneras, Mexico
1682	Beacon "DGO", Durango, Mexico
	Beacon "NAU", Nautla, Mexico
	Beacon "TGZ", Tuxtla, Mexico
1685	Beacon "DRC", Dos Rios, Colombia
1688	Beacon "CTM", Chetumal, Mexico
	Beacon "PVR", Puerto Villarta, Mexico
1690	Beacon "MDE", Medellin, Mexico
1693	Beacon "GYM", Guaymas, Mexico
1695	Beacon "TBU", Tibu, Mexico
1698	Beacon "ACA", Acapulco, Mexico
	Beacon "FRS", Fresnillo, Mexico
	Beacon "NVJ", Navojoa, Mexico
	Beacon "REX", Reymosa, Mexico
	Beacon "TGZ", Tuxtla, Mexico
1703	Beacon "ZAC", Zacatecas, Mexico
1705	Beacon "AFI", Amalfi, Colombia
1708	Beacon "MXL", Mexicali, Mexico
	Beacon "TAM", Tampico, Mexico
	Beacon "TAP", Tapachula, Mexico
1710	Beacon "BUN", Buensventura, Colombia
1718.5	Beacon "MZL", Manzanillo, Mexico
1718.59	NOAA marker beacons; also on 1718.65, 1798.5 and 1799.6 kHz
1720	Beacon "LET", Leticia, Colombia
	Beacon "TQN", Tres Esquinas, Colombia
	Beacon "VER", Vera Cruz, Mexico
1725	Beacon "SRL", Santa Rosalia, Mexico
1730	Beacon "MLM", Morelia, Mexico
1744.72	Corps of Engineers beacon at Ft. McHenry, MD
1745	Beacon "CGW", Cartago, Colombia
1750	Beacon "PLT", Plato, Colombia
1760	Japanese fishing buoy beacons
2080.4	KA2XTH, Harris Intertype in Gulf of Mexico
2182	Worldwide AM emergency calling frequency
2298.5	Corps of Engineers SSB net; also on 2301.5; 2324.5; 2327.5; 2343.5; 2346.5; 2348.5; 2351.5; 2602.5 and 2605.5 kHz
2398	NOAA marker beacons; also on 2456.0; 2510.0; 2848.0; 3281.0; 3300.4 and 3306.4 kHz
2776	NOAA National Weather Service
3023.5	Worldwide AM emergency frequency for search and rescue at the scene of the disaster
3230	State of Alaska emergency frequency
3278.5	Bureau of Indian Affairs
3281	Special aeronautical for flight tests
3288.465	Corps of Engineers beacon at Norfolk, VA; also on 3292.4 kHz
3303.4	Corps of Engineers beacons on Arkansas River; also on 3306.4 kHz
3335	Assigned to the ERDA
3340	Ship-to-ship USSR Pacific Ocean fishing fleet
3382.5	Rocket launching site, Woomera, Australia (VMG2)
3593	Backup police net in Switzerland (HEP, Berne; HEP3, Lausanne; HEP4, Geneva; HEP5, Basel and HEP6, St. Gallan)
3625.5	SSB communication net between LORAN stations in the western Mediterranean Sea
3670	Transpeninsular Baja California (Mexico) Highway emergency patrols (SSB)
3801.5	International Red Cross, Geneva, Switzerland (HBC88)
4050	SSB communications net between LORAN stations in the mid-Pacific Ocean (USCG)
4057	Huge communications net in Argentina (AM, CW and SSB)
4064.5	Police net between Tarawa and Gilbert Islands (SSB)
4125	Supplementary foreign Maritime distress frequency in Mexico, Central and South America, and the South Pacific Ocean
4165	Ocean buoy telemetry
4372.4	Mississippi/Ohio River "Coast" stations on SSB (WCM, Pittsburgh, PA; WFN, Louisville, KY; W GK, St. Louis, MO and WJG, Memphis, TN)

KHz	Purpose and/or Callsign(s)
4383.8	State of Alaska SSB emergency radio channel
4388.4	SSB Coast stations (KMI, Dixon, CA and WOO, Ocean Gate, NJ)
4394.8	SSB USN stations (NMC, San Francisco, CA and NMO, Honolulu, HI)
4417.2	SSB Coast Stations (KQM, Kahuku, HI; WAS, Duluth, MN and WLC, Rogers City, MI)

467,625	KAA8102, Disneyland, Orlando, FL

Listeners are reminded that the U.S.A. Communications Act of 1934, Section 305, as amended (47 U.S.C. Section 605), prohibits anyone, not authorized by the sender, from intercepting any radio communication not intended for reception by the general public, and divulging or beneficially using that information from such monitoring.

CONFIDENTIAL FREQUENCY LIST

Robert B. Grove

In the few years since its introduction, the CONFIDENTIAL FREQUENCY LIST has become the worlds' most sought-after directory of non-broadcast frequencies, callsigns and identifications. This entirely new edition includes material never previously published and distributed. Included are listings ranging from 14.1 kHz to 467.625 MHz. Categories include RTTY PRESS, UN Network, COAST STATIONS, TIME & STANDARD FREQUENCY, WEATHER, FOREIGN MILITARY, EMBASSY STATIONS, VOLMET, etc. Roughly 4500 frequencies are identified and their occupant and use listed. All categories are conveniently shown in order of increasing radio frequency.

Every listener with an all-wave general-coverage receiver needs a copy of the CONFIDENTIAL FREQUENCY LIST. This is the ONLY commonly available directory of the many otherwise unidentifiable radio signals you can easily hear outside the International Broadcasting Bands and the Ham Radio Bands.

ROBERT B. GROVE became interested in shortwave listening shortly after the close of World War II. An amateur radio ticket (W8JHD) quickly followed. A graduate of Kent State University with a Masters Degree from Florida Atlantic University, Bob has been a museum-planetarium director and TV public affairs director. He is now engaged in his favorite vocation, teaching physics and communications at the high school level (Nova High School, Ft. Lauderdale, FL)—the ham radio club there is no coincidence. Currently holding Advanced Class license, WA4PYQ, Bob has authored a variety of articles for electronics publications and is working on a new book about radio communications surveillance and monitoring techniques, as well as, the next "CFL".

GILFER Associates, Inc.

Park Ridge, New Jersey 07656 USA

Headphone Clearance -- one of each model

- SUPEREX:** This unusual headphone set can be modified by the user to change from low impedance to high impedance (interchange two wires in the plug). It is now set for 6-8 ohms low impedance, but can be changed to 600 ohms. These have large comfortable ear cups and headband. Might be a little heavier than some people like, but has excellent sound quality. Sold for \$24.95 and has only been used in our lab. A steal at \$12.00, delivered.
- AMPEX:** This is the last one of a bunch we had some years ago. They were the original Ampex stereo headphones for their famous Series 920 tape recorders. So comfortable that we rewired some for mono and use with shortwave receivers. Has 6-8 ohms impedance. Beautiful sound and comfortable tight fit. Five foot cord. Yours for \$11.00, delivered.
- TELEX:** We took this pair of CS-7 headphones in trade for some other equipment. Previous owner had installed metal plug (we don't know why). Test OK and very clean. Identical to current production Telex CS-7 headphones selling for much more. Only \$20.00, delivered.
- ILC Quiet-Com:** This manufacturer made headphones for NASA and the commercial airlines ground crew. Very tight fitting and will screen out noise. Excellent sound for CW/SSB or AM voice. Set for low impedance and has clever dual plug so that same set can be used with receivers requiring regular phone plug ($\frac{1}{4}$ ") as well as miniature plug (for Barlow XCR-30). These phones were pictured in Pop Science and Pop Mechanics. Discontinued. \$15.00 and they're yours.

Eddystone Model 940-C Receiver

\$370.00 (plus shipping)

This British built receiver (S/N 356) has been thoroughly re-conditioned. A number of GILFER modifications have been made to enhance its excellent DX'ing capabilities. A limited number of these unusual receivers were made before it was discontinued (too costly to manufacture). This is only the second one that we know of in the USA.

The 940 is a general coverage receiving system tuning 480 kHz to 30 MHz in 5 bands. The interior construction is typical "Eddystone"--very rugged and heavy. This is the ONLY SWL DX'ing receiver made in the last decade that had 2 r-f stages (one is a true cascode for the best possible sensitivity and lowest possible r-f shot noise). It uses 12 tubes (the 13th was removed and a solid-state rectifier was installed to reduce heat generation) and due to the two r-f stages, the image rejection is equal to that of a dual-conversion receiver (typically 70 dB at 8 MHz). The audio is push-pull, there are 3 i-f selectivity options and separate SSB detector. GILFER has built-in a 100 kHz calibrator and installed a tape recorder output jack.

A particularly impressive feature of the 940 is the huge slide-rule dial and the single-knob tuning control (geared down mechanical bandspread). The calibration is roughly 0.5% without using the calibrator, and better than 0.1 % with the calibrator checks. This exceptional receiver is so well constructed that it has many years of trouble-free life ahead of it. Weight 47 lbs. Measures 17"x10"x14".

R.L. Drake Model 2-C (with extras)

\$200.00 (plus shipping)

If you're interested in a low cost receiver with a lot of DX'ing potential, this might be just the receiver you've been looking for. The 2-C was a favorite among hams for a number of years (receiver now discontinued), but few people paid attention to the fact that it was also a good general coverage receiver. All you had to do was change crystals and you could tune 500-kHz wide segments anywhere in the shortwave spectrum. For its price, the 2-C is packed with features, including triple conversion, 100-kHz calibrator, noise blanker and Q-multiplier. If you take the time to make one simple graph, the 2-C can be used for near direct-frequency readout (see discussion of the 2-C by Neal Perdue in NASWA "Friendx", March 1975). We have re-conditioned one of these receivers and are selling it with the extra crystals to tune 3.0-3.5; 4.5-5.0; 6.0-6.5; 6.5-7.0; 9.5-10.0; 10.0-10.5; 11.5-12.0 and 15.0-15.5 MHz. This is a good buy for someone that doesn't want to spend a lot, but doesn't mind changing crystals. Comes complete with speaker and Manual.

Allied Radio Shack SX-190 (modified)

\$225.00 (plus shipping)

From time to time, we have a few of the well-known SX-190 receivers in stock for resale. We re-condition each receiver and make about 20 modifications to rid the receiver of some of the bugs that necessitate it being withdrawn from sale. These mods include changes in the agc, bfo and product detector, as well as a complete re-alignment and installation of new crystals. The usual receiver leaving here has crystals to tune the 500-kHz wide segments starting at 3.0; 4.6; 5.9; 7.0; 9.5; 11.0; 11.5; 12.0; 15.0; 17.5 and 21.4 MHz. This is a fine direct frequency readout receiver with excellent sensitivity and selectivity, plus a Q-multiplier. Requires a speaker.

Squires-Sanders IBS Receiver

\$460.00 (plus shipping)

This was the only professional communications receiver ever designed for strictly International Broadcast Band reception in the 11, 13, 16, 19, 25, 31, 40/41, 49 and 75 meter bands. A very small number were made for the Voice of America (USIA). They sold for \$1255.00. This is a unique radio receiver that is highly prized by DX'ers, language laboratories and recording enthusiasts.

The SS-IBS has practically every receiver refinement--including direct-frequency readout of its 9 500-kHz wide bands. There are 3 switch-selected selectivity options (2.5, 5 and 8 kHz), a large accurately calibrated S-meter, AGC switching, built-in IF noise clipping, excellent LSB and USB detection, built-in 100-kHz calibrator, RF gain control, tape recording output, true "Antenna Trim" front panel adjustment and motor assist tuning. Each main tuning knob revolution is equal to only 10 kHz. It is impossible to overload this receiver and it will not produce crossmod or false signals during the evening hours on the 40/41 and 49 meter bands.

This particular receiver has been thoroughly reconditioned in our lab and is in excellent condition. The SS-IBS uses 13 tubes and 10 diodes. It weighs 25 lbs and measures 8" high x 16½" wide and 14" deep. A separate matching speaker is included in this special price.

R.L. Drake SW-4A Receiver (modified)

\$260.00 (plus shipping)

We took a couple of these superb receivers in trades for SPR-4's and have them completely re-aligned, re-tubed and re-conditioned. Actually both were exceptionally clean to begin with. We have also modified each to improve the selectivity and is now better than 4.5 kHz bandwidth at -6 dB and 12 kHz at -60 dB. For better audio recovery, a full-wave detector has been added (in place of the old half wave detector). We put in a tape recorder output jack. These receivers have extra-fine audio quality. The SW-4A was the premier direct-frequency readout receiver designed for reception in the long wave band, AM broadcast band and the 49, 41/40, 31, 25, 19, 16, 13 and 11 meter International Bands. It is a hybrid receiver with 6 vacuum tubes, 7 transistors and 8 diodes. Powered by either 117 or 240 volts. Requires separate speaker.

R.L. Drake R-4B Receiver (modified)

\$470.00 (plus shipping)

To the serious country-hunting DX'er, the Drake R-4B receiver needs no introduction--it's used by more DX'ers with 150+ country totals than any other receiver. GILFER has just modified two of these fine receivers and in doing so we believe that we've vastly enhanced the R-4B's capability. Our first modification was to remove the ham band crystals (this was originally a ham band receiver) from the BAND switch and substitute crystals for the 4.5, 6.0, 15.0, 17.5 and 21.5 MHz bands. Then, the Fixed Frequency crystal socket was rewired to become Accessory crystal position #1. This permits the user to quickly substitute any other crystal not already installed in the basic receiver. Nine other crystals have been installed to cover the 2.0, 3.0, 7.0, 7.5, 9.0, 9.5, 10.0, 11.0 and 11.5 MHz bands (each over 500 kHz wide). A new mylar decal has been affixed over the old BAND and PRESELECTOR dial screens to distinguish this as a true SWL DX'ing receiver.

We've also installed full-wave AM detection in these R-4B's, increased the harmonic output from the built-in 100/25 kHz calibrator, speeded up the AGC release time, quicken the S-meter reaction time, increased the RF stage gain, and made a complete RF/IF alignment. All of the other goodies in the R-4B remain, including: pass band tuning, 4-step selectivity adjustment, impulse noise blanker, notch heterodyne filter, etc. A tape recording output jack has also been added. A separate speaker is required.

Document Carrier

For CRYPTOGRAPHIC, SECURITY or FAXING
DOCUMENTS OF VARIOUS SIZES AND WEIGHTS UP TO 1000g/m²

- * DIRECT Transmits documents even possible through walls, through concrete or stone.
- * DIRECT documents in any position and format such as complex reports, foreign language documents, etc.

- INSTRUCTIONS -

1. Place documents to be cryptographed or faxed on the protective sheet and the faxing sheet.
2. Lay the documents exactly containing the content documents on the direct carrier or sheet of Direct Documents into one of 4 pockets or slots.

The document carrier can be used in two ways (page 2)

Accessories

Telex CS-7 Headphones

One of the more desirable features to have in headphones is balanced sound — sound that is neither too bass-heavy nor too strident. Some very cheap headphones have little bass and are peaked for single-tone CW reception. Some other headphones (particularly stereo) have so much bass boost that any residual AC hum in the receiver modulates every signal. In our estimation, the only moderately-priced headphones with balanced sound are the Telex CS-7 (code C-1320). In hi-fi terminology, the sound they produce is non-fatiguing. The CS-7 phones are 600 ohms impedance and usable on low, medium or high impedance receiver output circuits. They are manufactured to strict professional standards with a moving coil dynamic transducer, stainless steel framework, nylon headband and earcups filled with soft ABS plastic. The headband is adjustable and the cord is 5 feet in length. Has a standard 1/4" plug.

Telex "Twinset"

Weighing only 1.6 ounce, the Telex HTC-2 "Twinset" has found favor among shortwave listeners that wear eyeglasses. The dual magnetic transducers rest on your temples away from the ears. Sound is channeled into the ear through an

adjustable tubular sound arm mounted on a ball and socket joint. The arm can be adjusted for position and the pressure on the ear itself is virtually non-existent. You can also swing one of the arms away from the ear to permit listening to conversation without removing the headset. These are low impedance (3 to 20 ohms) headphones that have sacrificed hi-fi sound quality for maximum speech intelligibility. Supplied with a standard 1/4" plug on a detachable 60" long light weight cable.

Books

SWL Address Book

Dexter 64 pages plus insert Updater

If you combine your shortwave listening with QSL card collecting you can't afford to be without Gerry Dexter's SWL ADDRESS BOOK. Here you'll find practical information on the exact address you should use to mail in a reception report, the name and title of the verification signer, type of response you can expect and how long it takes on the average, what language to use in your report, whether postage stamps or IRC's are required (or desired), and if tape recording are accepted and verified. The SWL ADDRESS BOOK is handy and easy to use. The information published (about 680 shortwave stations) was derived from "working experience" as opposed to "official" (and frequently inaccurate) sources. With Updater Sheet..

Sun, Earth and Radio

Radcliffe 265 pages

If you're mystified by the erratic nature of shortwave, here is the book that tells why radio signals behave as they do. This British author is renowned for his lucid descriptions of hard-to-grasp concepts without resorting to complex mathematical formulas and expressions. In SUN, EARTH AND RADIO, Radcliffe reveals just what we do and do not know about the ionosphere and its effects on radio signals. At this time of low sunspot numbers there is a need for additional emphasis on the correlation between good DX conditions and solar activity. Fading, ionospheric storms, sporadic-E, meteors, aurora, polar absorption, etc. are all discussed in readily understandable terms. This book has scores of two-color illustrations, charts, tables and photographs. We have the last copies of this book—which will not be reprinted due to the inflationary increase in printing costs. Order your copy today before we are sold out.

Wire Antennas (for radio amateurs)

Orr 192 pages

One of the fundamental truths in ham radio is, "You can't work them if you can't hear them!" And, the SWL corollary is, "the best receiver is a toy if connected to a poor antenna." Of course, almost any receiver will pull in some DX signals with a length of unresonated wire attached to the antenna input terminal. What separates the SWL from the DX'er is the antenna the latter is using. WIRE ANTENNAS is slanted toward the radio amateur, but everything written applies—in some measure—to the SWL. Although the dimensions of antennas you can build are given for the ham bands, the simple formulas enable you to adapt them to the international broadcasting bands. For example, by subtracting just a few feet of wire, an antenna for the 80 and 40 meter ham bands, works in the 60 meter Tropical band and 31 meter broadcast band. This book is particularly recommended for its down-to-earth information on feedlines, construction details and practical ideas. If you're stuck in an apartment, you should try the "Quad Loop" (page 132) with your SPR-4. If you've got a lot of backyard space, try the "Multi-Band Dipole" (page 75).

SWL Antenna Construction Projects Noll 128 pages

Shortwave listening is somewhat like fly fishing; if you're not hearing the DX stations you think you should, try a different antenna arrangement and see what you can catch. There are dozens of possible receiving antenna hookups, some designed for farm land, some for suburban backyards, and even some for apartments. This book was written for the listener that wants to improve reception and is willing to experiment with antennas. The author tells why a good antenna is necessary for DX'ing and what distinguishes a good antenna from a bad antenna. There are 35 different construction plans, including indoor and outdoor antennas, vertical or horizontal antennas, long wires, beams, and even multiple band antennas. This is a thought provoking book and one of the very best on the subject.

The Complete Short Wave Listener's Handbook

Bennett 288 pages

In very simple terms, this is probably the best basic book on shortwave listening that has come down the pike in several years. THE SW LISTENER'S HANDBOOK covers just about everything you could possibly want to know about SWL'ing. The author uses a lot of words (some say the book is meaty) and brings in a lot of personal remembrances. But, for ease of reading, comprehension and in many ways—thoroughness—THE SW LISTENER'S HANDBOOK is difficult to fault. The chapter headings are: Terminology, Radio Receivers, Antennas, Frequencies, Propagation, Reception by Continental Area, Amateur Radio, CB, FM DX'ing, TV DX'ing, Utility Stations, Logbooks, Reporting and Verifications, Time and Standard Frequencies, Card Swapping, Clubs, and WDX Callsigns and Awards.

WTFDA TV Station Guide

62 pages: 8½" x 11"

Frequency (and channel) listings are OK, but we like the quick overview you get from a good outline map. And, this is just what the Worldwide TV-FM DX Association published in their recently released TV STATION GUIDE. The GUIDE comprises a number of outline maps of North America with a facing page (the book is spiral bound to lay flat on your desk) of detailed station information. The maps give you a graphic idea of where TV stations are located with notations concerning network affiliation and frequency offset. The facing page lists the state, city, callsign, network, effective radiated power, antenna height and the edition of the weekly "TV Guide Magazine" where local programming is published. A separate set of maps for channels 2 through 6 show TV stations known to be on the air from Central America, the Caribbean and the countries of Colombia, Ecuador and Venezuela. This is the only publication of its kind.

Accessories

Franklin 24 Hour GMT Clock

8" diameter

Those digital clocks are handsome and impressive, but for SWL'ing you can't beat the cleancut time-at-a-glance appearance of these Franklin 24-hour clocks. We've had one running for months and can testify to its accuracy and synchronization with the 60 Hz a-c power line. Unless you suffer from frequent power outages, this is the clock for your listening post. The photo shows the 1976 model. The sweep hand is reading seconds and the long black hand reads minutes past the hour. The shorter black hand reads GMT hours (0948:06 in the photo). The white face plate is 8-inches in diameter and the power cord is about 7 feet long. A 12-inch model is available on special order. The smaller model can be read at a distance of 10 to 12 feet without difficulty. Noiseless.

Mosley SWL-7 Receiving Antenna

If your interest is in DX'ing the major International Broadcast Bands, the Mosley SWL-7 antenna is the most unique item of its kind that we sell. Through the use of 8 sealed pre-tuned electronic "traps," the SWL-7 resonates in the 11, 13, 16, 19, 25, 31 and 49 meter bands. Resonating your antenna will double or triple signal

strength—when compared to a simple unresonated long wire—in these particular bands. A typical trap is shown in the photo. The SWL-7 is shipped disassembled and will require 2 hours to erect. You must have 50 feet of air space as high as possible above ground level. Technically, the SWL-7 is a tuned horizontal dipole fed from the center with 75-ohm twinlead cable (100 feet supplied). GILFER does not recommend the SWL-7 for serious DX'ing on the medium wave band or any of the Tropical Bands. We ship the SWL-7 via UPS or insured Parcel Post.

Receivers

made to also cover the Tropical Broadcast, Maritime, Aeronautical, Ham, CB, etc. bands. We will customize the FREQUENCY SELECTOR dial according to your crystal selection at a modest charge. GILFER can also install a 100 kHz calibrator, impulse noise blanker or RTTY adapter, as optional cost extras. The SPR-4 is 100% solid-state using 28 transistors, 21 diodes and 1 integrated circuit. It may be powered from either 117 or 240 volts, 50-60 Hertz, or 12 volts DC through an optional power cord. The front panel controls are PRESELECTOR, RANGE, RF GAIN, FREQUENCY SELECTOR, AUDIO GAIN, MAIN TUNING, MODE (AM, CW, LSB or USB) and NOTCH (a heterodyne filter). There is a headphone jack on the front panel and a tape output jack on the rear skirt. We would be pleased to send you further technical details and our special SWL discount price on receipt of a stamped self-addressed business envelope.

Barlow Wadley XCR-30

Many shortwave listeners have been lavish in their praise of the Barlow Wadley XCR-30 receiver. ELEMENTARY ELECTRONICS said (November 1975) that this, "...is the finest portable receiver we have ever seen or used..." Undeniably, the XCR-30

introduced a new concept in low cost direct frequency readout receivers. For the first time, you can dial or readout any frequency from 500 kHz to 31 MHz within ± 5 kHz without resorting to calibration graphs or charts. And, there is absolutely no drifting off frequency. Because it is a general coverage receiver, the XCR-30 is of use to the shortwave listener, amateur radio operator, language student or professor, research scientist, etc. Measuring 11½" Wide X 7½" high X 3 7/8" deep,

the XCR-30 weighs in at 9 lbs and 2 oz with its 6 D cell batteries (not supplied) in place. The sensitivity is measured at better than 2 microvolts above 3 MHz and 5 to 15 microvolts below 3 MHz. Selectivity is switched according to mode of reception and is nominally 7.5 kHz at 6 dB down on AM and 3.8 kHz wide at 6 dB down on either LSB or USB. Image rejection is better than 50 dB. The circuit uses the special Wadley loop and is a design concept now used in most \$3000+ receivers. The front panel controls include MHz SET, kHz SET, PRESELECTOR, MODE (AM, LSB and USB), VOLUME, SSB CLARIFIER and ZERO SET. There is a signal strength tuning meter, headphone jack and connections for external antenna and ground. Manufactured in South Africa. We will send you our detailed Technical Specification sheet on receipt of a stamped, self-addressed business envelope.

Accessories

Logging & Record Sheets

1500 Entries

How do you keep track of your loggings? Do you use scraps of easily misplaced paper or an old steno pad? Why not the sensible alternative, our special logging sheets—the new ones with the green ink on the lighty-tinted green paper. Each

[illegible]

sheet has columns for Date, Time, Frequency/Dial Setting, Station Heard, Language, Program/Transmission, SIO, Remarks, plus checkoff boxes for New Frequency (in use), New Station and Report Sent. Note the use of the preferred SIO reporting code (replacing SINPO code). At the top of each sheet is a list of 28 of the most commonly used abbreviations. These professionally prepared sheets are padded with cardboard backing for use on your desk, and punched for a 3-ring notebook binder for permanent record keeping.

QSL Card Display Album

If you marvel at the attractive QSL cards you can receive for verifying DX stations, you'll want to display them to other listeners. There's no better way than this sturdy simulated-leather-finish album. Each album is sold with 50 transparent 5" x 7" soft Polystyrol plastic pockets. The black backing filler in each pocket may be removed to display both sides of your QSL's — or display the face of each card putting them back to back. Additional pockets are available. Albums are available in green, red, blue and black. Please specify a first and second choice of color when ordering. This is an exceptionally practical gift.

Reception Reporting Forms

Not every listener can expect the same results, but a typical comment about the

GILFER REPORTING FORMS is, "Radio Abidjan never answered my straight English language reports, but your tri-lingual form got me a QSL in 6 weeks!" These forms are our exclusive innovation and designed so that each important English phrase is translated (line for line) into French and Spanish. They can be filled in on a typewriter and have just the right amount of space to insure that your report gets immediate attention—and save the broadcaster time and effort, too. You simply insert the station call or slogan, frequency, date, time, program heard, SIO or SINFO reception code, interference, equipment you used and add any pertinent remarks. The forms are padded with cardboard backing and printed on medium weight paper.

MAIL-A-PROP

Subscription Service

Want to know when to tune for that elusive DX station? Why not subscribe to a propagation forecasting service? MAIL-A-PROP can give you the answers in simple language and with surprising accuracy. It will even tell you what sort of DX conditions to expect day-by-day. This is a bi-weekly service with timely items on solar and geomagnetic activity, sunspot cycle predictions, VHF opening predictions, and much more. Mailed via First Class. A trial 2-month subscription is also available. A sample MAIL-A-PROP is yours for a stamped self-addressed envelope.

Better Shortwave Reception

Cowan & Orr 160 pages

It's unnecessary to be an electronics technician to enjoy shortwave listening. However, an understanding of what's going on behind that dial scale may help you get everything possible out of your receiver. This book is in its 4th edition and the authors have almost completely revised the text. Major emphasis is placed on your receiver; how it functions, how to buy a good one, how to align and how to do preventive maintenance. Thorough discussions of VHF receivers (tunable and scanners) and VHF propagation appear in two new chapters. Other headings in this informative book include; Listening To The World, Shortwave Reception — The Easy Way, Better Antennas, Reception Techniques, and Eavesdropping On The World. Superior photos and graphics.

From Semaphore to Satellite

11½" x 9", 344 pages

We have just imported from the International Telecommunications Union in Geneva, Switzerland, the last few copies of this important lavishly-illustrated history of communications. This is a hard cover book containing over a thousand drawings, photos and paintings depicting the invention, development and usage of radio, radar, telegraphy, television and facsimile. The illustrations and descriptive text make this book the most impressive volume on the history of broadcasting and communications ever published. No SWL library is complete without this book. It makes an unusually attractive gift. Shipped double-boxed.

Receivers

R. L. Drake SSR-1

Here's a brand-new product from the world-renowned R. L. Drake Company. Just introduced, the Model SSR-1 is a 17 transistor, two IC and 30 diode "base station"

metal-cased receiver covering the full range of 500 kHz to 31 MHz. Operationally, the SSR-1 is one of the new breed of receivers where the listener dials the desired "MegaHertz" and fine tunes with a separate "kiloHertz" slow motion

dial. Frequencies can be read to within ± 5 kHz. Sensitivity is claimed by the manufacturer to be better than 2 microvolts. The selectivity is automatically narrowed when switching from AM to either LSB or USB—and there is a separate product detector. Drake's new SSR-1 features a regulated built-in 117 or 240 volt AC power supply, as well as an internal 8 D-cell battery supply (batteries not included). The power circuit automatically switches from rectified AC to battery when the power cable is disconnected (or the AC power fails). Additional features include a muting jack, standard phone jack on front panel, S-meter and a "Local-Distant" attenuator switch on the rear skirt. Manufactured in Japan. We will be pleased to send you our special SWL discount price.

R. L. Drake SPR-4

This is the most popular receiver we sell that is designed specifically for superb AM broadcast and shortwave distant (DX) reception. The SPR-4 features high-accuracy

direct-frequency dialing, excellent selectivity and station-separating ability, and a short-wave sensitivity of about 1 microvolt (0.5 microvolt for SSB). The basic receiver has ten 600+ kHz wide bands and tunes from 150 to 1600 kHz, as well as, the complete 49, 41/40, 31, 25, 19, 16 and 13 meter International Broadcasting Bands.

GILFER will program this receiver to tune up to 14 other bands according to your selection by installing appropriate crystals (\$5.00, each). Thus, the SPR-4 can be
